PRIVACY VAULT
SCREEN PLAN

Mobile App Development — Semester 5 | COMSATS University Islamabad, Abbottabad Campus

Project Summary

Privacy Vault is a local-first Flutter UI concept for organizing purchase receipts, warranty information, and personal privacy-consent records. This submission demonstrates the interface using sample data only. Database storage, API calls, and screen navigation are intentionally not implemented for this assignment stage.

Screen Plan

#	Screen	Purpose / Main content	Dart file	Main UI elements
1	Home Screen	Main overview of Privacy Vault; shows receipt and warranty counts, privacy summary, and key actions as display-only cards.	home_screen.dart	Image assets: privacy.png, receipt.png, warranty.png; summary cards and icons.
2	Receipt List Screen	Displays saved sample purchase records and their store, date, and price.	receipt_list_screen.dart	Reusable ReceiptCard used four times with different dummy data.
3	Add Receipt Screen	Look-only form for product name, store name, purchase date, and price.	add_receipt_screen.dart	TextField controls and a demo Save button; no data is persisted.
4	Vault Records Screen	Shows privacy-consent summary and sample warranty records.	vault_records_screen.dart	Reusable WarrantyCard and image/icon elements.

Main Entity

Receipt — the main sample entity represented in the UI. Its fields are Product Name, Store Name, Purchase Date, and Price. Receipt list cards display these values. The form is a visual mock-up only; values are not saved.

Reusable UI Components

ReceiptCard is reused four times on the Receipt List screen. WarrantyCard is reused for sample warranty entries on the Vault Records screen. Shared styling uses a purple accent (#6750A4), light background (#F8F7FC), Material icons, Card, Padding, Row, Column, Expanded, alignment, and spacing widgets.

Assets and Bonus Feature

Three PNG files are included and registered in pubspec.yaml: assets/images/privacy.png, assets/images/receipt.png, and assets/images/warranty.png. A custom Privacy Vault shield launcher icon is included for Android in all five standard density folders.

Submission checklist

- ■ Project source: lib/ and pubspec.yaml
- ■ Assets folder: assets/images/
- ■ Run flutter pub get and flutter analyze from the project root
- ■ Capture one screenshot per screen by temporarily changing home: in main.dart
- ■ Restore HomeScreen as the default before final submission

Prepared for the Mobile App Development assignment. Add group-member details if required by your instructor.
